Microsoft Exchange Security Vulnerability Has No Impact on ZuntaFi Data

Aberdeen, SD, March 16, 2021 – On March 2, 2021, a zero-day vulnerability affecting Microsoft's Exchange server was announced. ZuntaFi utilizes Microsoft Exchange servers for email communications and took immediate action to keep customer and partner information safe.

Upon receiving the publicly disclosed information of the vulnerability on March 2, ZuntaFi patched servers as defined and directed by Microsoft. A forensics investigation was also immediately conducted to search for any Indicators of Compromise to determine any possible exposure.

Following the government's Cybersecurity and Infrastructure Security Agency (CISA) and ZuntaFi's comprehensive security partner action plans, a system review revealed no Indicators of Compromise. Investigations also confirmed there was no unauthorized access to systems, nor any unwanted code or processes.

"We take cyber security seriously. Protecting customer data remains a top priority within our organization.

- Tom Ullrich, IT Sys/Ops and Security Manager
